-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

1) Responsive to communication(s) filed on \_\_\_\_ .

2a) This action is **FINAL**.      2b) This action is non-final.

3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

4) Claim(s) 1-51 is/are pending in the application.

4a) Of the above claim(s) \_\_\_\_ is/are withdrawn from consideration.

5) Claim(s) \_\_\_\_ is/are allowed.

6) Claim(s) 1-5,10-12,17-32,37-39 and 44-51 is/are rejected.

7) Claim(s) 6-9,13-16,33-36 and 40-43 is/are objected to.

8) Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

9) The specification is objected to by the Examiner.

10) The drawing(s) filed on 10 March 2000 is/are: a) accepted or b) objected to by the Examiner.

Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

11) The proposed drawing correction filed on \_\_\_\_ is: a) approved b) disapproved by the Examiner.

If approved, corrected drawings are required in reply to this Office action.

12) The oath or declaration is objected to by the Examiner.

**Priority under 35 U.S.C. §§ 119 and 120**

13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

a) All b) Some \* c) None of:

1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. \_\_\_\_ .
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

14) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

a) The translation of the foreign language provisional application has been received.

15) Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Art Unit: 2621

**DETAILED ACTION**

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 4/29/04 has been entered.

***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-5, 10-12, 17-32, 37-39, and 44-51 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chui et al. (US Patent No. 6,229,926. Referred as '926 hereinafter) in view of Chui et al. (US Patent No. 5,600,373. Referred as '373 hereinafter).

Regarding claim 1, Chui '926 teaches a method for encoding an digital image (see data processing circuitry 106 of figure 1 comprising machine 200 for performing encoding/compressing (col. 6 lines 17-26) digital image captured by the image capture device 102 in figure 1 (col. 6 lines 17-19 and col. 3 lines 16-23) comprising a plurality of pixels (see figure 2 and its corresponding text portion mentioned in col. 4 lines 28-41. Note that each tile 144 of an array of 4x8 tiles of raw image data shown in this figure comprising an array of 32x32 i.e., 32 rows by 32 column in which each row and each column represent each pixel in the X position and each pixel in the Y position. Thus the 32x32 block does represent the 32x32 pixel block image captured by the camera 102 and such pixel is further processed by the data processing circuitry 106 according to figure 1), said image being able to be transformed by a discrete wavelet transform to a predetermined level of decomposition (see data processing circuitry 106 comprising machine 200 for image transformation (figure 1 and col. 6 lines 17-26). Note the transformation used in machine 200 is a wavelet transformation technique according to col. 1 lines 10-12 and col. 4 lines 47-48 and figure 2 (note the number 1-4 to the end of LL, LH, HL, and HH refer to the level of decomposition). Also refer the lengthy discussion about wavelet transformation method in col. 7 to line

Art Unit: 2621

6 of col. 8) and capable of being encoded on a block by block basis (see tile 144 shown in figure 2. Note that each tile 144 having a 32x32 block is transformed by wavelet transformation method and encoded by machine 200 included in data processing circuitry 106 as discussed above), each block having a specified block size in number of coefficients (see either 32x32 pixel block of tile 144 or array of 4x8 tiles of raw image data shown in figure 2), in a first and second dimensions (refer rows and column shown in figure 2), the method comprising:

a) dividing the image into a plurality of tiles, each tile having firstly, substantially a minimum number of pixels required to produce the number of coefficients in the first dimension of said block at said predetermined level of DWT decomposition, wherein said predetermined level is greater than one, and secondly, less than a minimum number of pixels required to produce the number of coefficients in the second dimension of said block at said predetermined level of DWT decomposition (see figure 2 which clearly teaches these features. Note that the raw image data comprises 32 tiles or an array of 4x8 tiles in which each tile is a 32x32 pixel block as discussed above. As to the newly added features of "wherein said predetermined level is greater than one", the "x" mentioned in col.4 lines 65-66 and

Art Unit: 2621

having values of 1-4 as shown in figure 2 (note the number 1-4 to the end of LH and HL) corresponds to this claimed feature);

b) selecting a current tile (see figure 2 which shows one of the tile 144 is selected and decomposed);

c) decomposing said current tile using DWT to at least one level of decomposition to form a plurality of subband including LL, LH, HL, and HH subband (see figure 2 which shows the selected tile is decomposed by using wavelet transformation as discussed above. This process is by the machine 200 of figure 1 employed wavelet transform method as discussed above);

e) accumulating LL subband coefficients and repeating steps b) to e) until a predetermined number of coefficients, dependent on the specified block size, of the LL subband have been accumulated (see table 1 shown in col. 7 and figure 5A clearly shows these features. The size of a tile shown in figure 2 and mentioned in col. 4 lines 31-34 corresponds to the newly added feature of "specified block size");

f) assigning as a current tile said predetermined number of accumulated LL subband coefficients (see "LL" shown in figure 2;

g) repeating step c) to g) until the predetermined level of decomposition is reached (see figure 2. Note the numbers 1-4 suffixed to the subbands and "iteration" mentioned col. 4 lines 56-67); and

Art Unit: 2621

h) encoding the LL subband into the bit stream (see last line of col. 4 and col. 4 line 23-25).

Chui '926 fails to explicitly teach the features recited in step d). However, such features are well known in the art as evidenced by Chui '373.

Chui, in the same field of invention, that of image compression, teaches these features recited in steps d): accumulating coefficients in each subband of the LH, HL and HH subbands to form blocks of said specified size (see figure 6 where quantisation 42 accumulates and quantizes components LH, HL, and HH; and the "sum of the coefficients in the LH, HL, and HH components of the decomposed image" mentioned in col. 26 lines 54-55 and shown in figure 13b) and encoding each said block to a bit stream (see compression 44 of figure 6).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate such accumulating as taught by Chui '373 in combination with Chui '926 because by incorporating such features would allow to meet a desired compression ratio as suggested by Chui '373 in col. 26 lines 25-30.

The advanced statements with regard to claim 1 above are incorporated hereinafter.

With regard to claim 10, Chui '373 further teaches features recited in step e) as mentioned in col. 26 lines 17-32. With regard to claim 21, both Chui '926 and '373 teach storage means (see working memory 104 in figure 1 of Chui '926 and video source 12 of figure 4a of Chui '373), filter means (see filter mentioned in line 6 of col. 7 in Chui '926; and filters 50 & 52 of figure 7 in Chui '373), partial band storage means (see working memory 104 of figure 1 in Chui '926, and storage 46 of figure 6 in Chui '373).

With regard to claims 28 and 37, Chui '926 further teaches the use of computer program stored on a computer readable memory medium (see col. 23, lines 18-23).

Claims 20 and 47-49 are also rejected for the same reasons as set forth in claim 1 because they recite the analogous features as recited in claim 1.

Regarding claims 2-5, Chui '926 further teaches these features (see figure 2).

Claims 11-12 are also rejected for the same reasons as set forth in claims 2-5 above.

Regarding claim 18, Chui '373 further teaches arithmetic encoder (col. 1 lines 60-61).

Art Unit: 2621

Regarding claims 17, 19, 22-26, and 44-46, Chui fails to explicitly teach bit plane encoder and hybrid encoder because these encoders are well known (Official Notice) in the art.

The advanced statements with regard to claims 2-5 above are incorporated herein. With regard to claims 29-32, 38-39, Chui '926 further teaches use of computer program stored on a computer readable memory medium (see col. 23, lines 18-23).

The advanced statements with regard to claim 1 above are incorporated herein. Both Chui '926 and '373 teach a decompression system (see machine 202 for performing decompressing shown in figure 1 of Chui '926; and decompressor 18 shown in figure 4a of Chui '373) as required by claims 50-51.

***Allowable Subject Matter***

4. Claims 6-9, 13-16, 33-36, and 40-43 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Regarding claims 6, 13, 33, and 40, the closest prior art (Chui '926) fails to teach or suggest the features recited in claim. Claims 7-9, 14-16, 34-36, and 41-43 is also allowable as being dependent upon the allowable based claims.

5. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Duy M

Art Unit: 2621

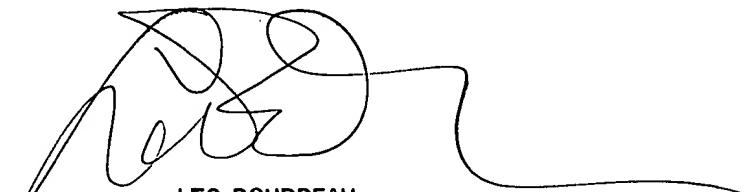

Dang whose telephone number is 703-305-1464. The examiner can normally be reached on Monday to Thursday from 6:30AM to 5:00PM..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Leo H Boudreau can be reached on 703-305-4706. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
